Lesson Focus
Lesson focuses on the concept of Biomimicry and students learn how engineers have incorporated structures and methods from the living world in products and solutions for all industries. Students then work in teams to develop a structure or system based on an example in nature that would help people living on the moon. They design their structure on paper, learn about patents, and share their designs with the class.

Lesson Synopsis
The "Biomimicry in Engineering" lesson explores how nature provides inspiration to engineers, both in terms of aesthetics and practical solutions to challenges. Students review current applications and then work as a team to develop a structure or system that would help support people living on the moon. They sketch their plans, consider patent rights, and present to their class.

Age Levels
8-18.

Objectives
- Learn about biomimicry.
- Learn about engineering design and redesign.
- Learn about patents.
- Learn how engineering can help solve society's challenges.
- Learn about teamwork and problem solving.

Anticipated Learner Outcomes
As a result of this activity, students should develop an understanding of:
- biomimicry
- engineering design
- patents
- teamwork

Lesson Activities
Students explore how engineers have incorporated systems, materials, and methods from nature into manmade products, materials, and methods found in all industries. Students look to natural examples to create on paper a structure or system that would support people living on the moon. They consider patenting options and present their ideas to the class.
Resources/Materials

- Teacher Resource Documents (attached)
- Student Resource Sheet (attached)
- Student Worksheet (attached)

Alignment to Curriculum Frameworks

See curriculum alignment sheet at end of lesson.

Internet Connections

- TryEngineering (www.tryengineering.org)

- ITEA Standards for Technological Literacy (www.iteaconnect.org/TAA)

Recommended Reading

- Biomimicry for Optimization, Control, and Automation (ISBN: 978-1852338046)

Optional Writing Activity

- Write an essay or a paragraph about one example of how engineers have looked to nature to help find solutions to societal challenges.
For Teachers:  
Teacher Resources

Lesson Goal  
The "Biomimicry in Engineering" lesson explores how nature provides inspiration to engineers, both in terms of aesthetics and practical solutions to challenges. Students review current applications and then work as a team to develop a structure or system that would help support people living on the moon. They sketch their plans, consider patent rights, and present to their class.

Lesson Objectives  
- Learn about biomimicry.  
- Learn about engineering design and redesign.  
- Learn about patents.  
- Learn how engineering can help solve society's challenges.  
- Learn about teamwork and problem solving.

Materials  
- Student Resource Sheets  
- Student Worksheets  
- Student Team Materials: paper, pen, pencil; access to the internet is optional though helpful.

Procedure  
1. Show students the student reference sheets. These may be read in class or provided as reading material for the prior night's homework.  
2. To introduce the lesson, consider asking the students how nature engineers a product -- like a leaf. Ask them to think about the functionality of shapes such as a conch shell or palm leaf, and how they support the structure. Another point might be to look at how a lotus leaf beads up water... and consider that it is the tiny "hairs" on the surface of the leaf that suspend water beads.  
3. Teams will consider their challenge, conduct research into other examples of biomimicry and decide whether they are going to design a building, a system, or some other product for use on the moon that incorporates biomimicry.  
4. Teams next develop a detailed drawing showing their product or system from at least two perspectives and including a written description of how the design works.  
5. Teams present their ideas to the class and complete a reflection sheet.

Time Needed  
One to two 45 minute sessions.
**What Is a Patent?**
A patent for an invention is the grant of a property right to the inventor, issued by a country's Patent and Trademark Office. The procedure for granting patents, the requirements placed on the patentee, and the extent of the exclusive rights vary widely between countries according to national laws and international agreements. In the United States, the term of a new patent is 20 years from the date on which the application for the patent was filed or, in special cases, from the date an earlier related application was filed, subject to the payment of maintenance fees. *Utility patents* protect useful processes, machines, articles of manufacture, and compositions of matter. Some examples: fiber optics, computer hardware, medications. *Design patents* guard the unauthorized use of new, original, and ornamental designs for articles of manufacture. The look of a specific athletic shoe or a bicycle helmet are protected by design patents. *Plant patents* are the way we protect invented or discovered asexually reproduced plant varieties. Hybrid tea roses, Silver Queen corn, and Better Boy tomatoes are all types of plant patents.

**Famous Patents**

**Safety Pin:** The patent for the "safety pin" was issued on April 10, 1849 to Walter Hunt, of New York. Hunt's pin was made from one piece of wire, which was coiled into a spring at one end and a separate clasp and point at the other end, allowing the point of the wire to be forced by the spring into the clasp.

**Dishwasher:** A patent for the first practical dish washing machine was issued December 28, 1886 to Josephine Garis Cochran of Shelbyville, Illinois. She was wealthy, entertained often, and wanted a machine that could wash dishes quickly, and without breaking them. When she couldn't find one, she built it herself.

**How to Register a Patent**

Each country, or sometimes a region has its own patent procedures. For example, in Europe, there is the European Patent Office; in the United States, the U.S. Patent and Trademark Office manages the patent process. Wherever you are, you have to design your product on paper or on a computer and specifically show why your design is different from others. On the left is one of the first drawings of the Coca Cola bottle, and on the right, is a copy of the patent design. You also need to check to see if someone else has already invented what you think you did! Try searching for a trademark at www.uspto.gov/patents.
Student Worksheet: What is Biomimicry?

People have always been inspired by nature -- and engineers are no exception! Throughout history, structures, systems, and materials developed by engineers have had roots in natural structures, systems, and materials. For example, the echolocation used by bats in the dark have helped lead to improvements in cane technology for blind people. Others have looked to the methods beetles use to draw water from fog, or how the structure of a lotus leaf can help keep moisture away from the surface -- this has led to changing the surface of fabrics at the nanoscale so they too repel water. And, gecko tape mimics the feed of a gecko lizard by including nanoscopic hairs. Other engineers have looked to the way tower building termites have structures designed to maintain a constant temperature in climates with wide temperature swings. The Eastgate building in Harare, Zimbabwe has passive, self-cooling systems modeled on termite mounds. The building, a mixture of offices, shops and car parking, uses an average of 90 per cent less energy than a comparable structure saving more than $3.5 million since opening in the 1990s.

◆ How butterflies' wings could cut bank fraud

University of Cambridge scientists and engineers recently discovered a way of mimicking the stunningly bright and beautiful colours found on the wings of tropical butterflies. The findings could have important applications in the security printing industry, helping to make bank notes and credit cards harder to forge. Mimicking nature's most colourful, eye-catching surfaces has proved elusive. This is partly because rather than relying on pigments, these colours are produced by light bouncing off microscopic structures on the insects' wings. Mathias Kolle, working with Professor Ulrich Steiner and Professor Jeremy Baumberg of the University of Cambridge, studied the Indonesian Peacock or Swallowtail butterfly (Papilio blumei) (Image at right is courtesy: University of Cambridge), whose wing scales are composed of intricate, microscopic structures that resemble the inside of an egg carton. Because of their shape and the fact that they are made up of alternate layers of cuticle and air, these structures produce intense colours. Using a combination of nanofabrication procedures - including self-assembly and atomic layer deposition - Kolle and his colleagues made structurally identical copies of the butterfly scales, and these copies produced the same vivid colours as the butterflies' wings. As well as helping scientists gain a deeper understanding of the physics behind these butterflies' colours, being able to mimic them has promising applications in security printing.

◆ China Winter Olympics

The National Aquatic Center in Beijing, China structure stands on enormous twisted beams around the exterior similar to a nest. The designing team studied some countless natural nests for understanding the weaving pattern of the threads. Some hundreds of models were created for the design.

♦ Engineering Teamwork and Planning
You are part of a team of engineers given the challenge of developing a system or building that would be based on the moon that is based on a product or system found in nature. You'll research ideas online, then work as a team to develop a drawn diagram. You'll also consider patenting your idea, and present your designs to your class.

♦ Research Phase
Read the materials provided to you by your teacher. If you have access to the internet, also visit Asknature.org, and take some time to explore the various challenges and solutions nature has to offer. For example, you might search for "store oxygen" or "termites" or anything related to what you are considering working on. Gain ideas by seeing what others are working on.

♦ Planning and Design Phase
Leonardo da Vinci both studied how birds fly and also drew intricate illustrations of his designs in preparation for construction. In the same way, George de Mestral, a Swiss engineer hiking in the Alps found that many burs from a burdock tree were sticking to his clothing....he later invented what is now known as Velcro. But he also had to draw his ideas in order to gain a patent for his invention. You can see one page of his patent to the right.

Now it is your turn! On a separate piece of paper draw a detailed diagram showing several views of your system, similar to what might be required for a patent. Present this plan to your class. Be sure to list the materials you might need and include a paragraph or more describing how your invention works and how it relates to nature....what makes it an example of Biomimicry?

♦ Presentation Phase
Present your ideas, drawings, and connection to Biomimicry to the class, the complete the reflection sheet.
Student Worksheet:

Reflection
Complete the reflection questions below:

1. What was the most interesting proposed use of biomimicry that was developed in your class presentations? Why?

2. Do you think that your design is patentable? Is it unique enough to be approved?

3. Do you think your product, building, or system would work if manufactured?

4. Do you think that you could raise funds to pay for manufacturing? How would you go about raising funds?

5. Do you think that many engineers explore solutions from nature into their inventions?

6. Did you think that working as a team made this project easier or harder? Why?
For Teachers:
Alignment to Curriculum Frameworks

Note: Lesson plans in this series are aligned to one or more of the following sets of standards:
- U.S. Science Education Standards (http://www.nap.edu/catalog.php?record_id=4962)
- U.S. Next Generation Science Standards (http://www.nextgenscience.org/)
- International Technology Education Association's Standards for Technological Literacy (http://www.iteea.org/TAAPDFs/xstnd.pdf)
- U.S. Common Core State Standards for Mathematics (http://www.corestandards.org/Math)
- Computer Science Teachers Association K-12 Computer Science Standards (http://csta.acm.org/Curriculum/sub/K12Standards.html)

◆ National Science Education Standards Grades K-4 (ages 4-9)

CONTENT STANDARD A: Science as Inquiry
As a result of activities, all students should develop
- Abilities necessary to do scientific inquiry
- Understanding about scientific inquiry

CONTENT STANDARD C: Life Science
As a result of the activities, all students should develop understanding of
- The characteristics of organisms
- Organisms and environments

CONTENT STANDARD D: Earth and Space Science
As a result of their activities, all students should develop an understanding of
- Properties of earth materials

CONTENT STANDARD E: Science and Technology
As a result of activities, all students should develop
- Abilities of technological design
- Abilities to distinguish between natural objects and objects made by humans

CONTENT STANDARD F: Science in Personal and Social Perspectives
As a result of activities, all students should develop understanding of
- Science and technology in local challenges

◆ National Science Education Standards Grades 5-8 (ages 10-14)

CONTENT STANDARD A: Science as Inquiry
As a result of activities, all students should develop
- Abilities necessary to do scientific inquiry
- Understandings about scientific inquiry

CONTENT STANDARD C: Life Science
As a result of their activities, all students should develop understanding of
- Structure and function in living systems
- Diversity and adaptations of organisms

CONTENT STANDARD E: Science and Technology
As a result of activities in grades 5-8, all students should develop
- Abilities of technological design
- Understandings about science and technology

CONTENT STANDARD F: Science in Personal and Social Perspectives
As a result of activities, all students should develop understanding of
- Science and technology in society
For Teachers:
Alignment to Curriculum Frameworks (cont.)

◆ National Science Education Standards Grades 5-8 (ages 10-14)
  CONTENT STANDARD G: History and Nature of Science
  As a result of activities, all students should develop understanding of
  ➤ History of science

◆ National Science Education Standards Grades 9-12 (ages 14-18)
  CONTENT STANDARD A: Science as Inquiry
  As a result of activities, all students should develop
  ➤ Abilities necessary to do scientific inquiry
  ➤ Understandings about scientific inquiry

CONTENT STANDARD B: Physical Science
As a result of their activities, all students should develop understanding of
  ➤ Structure and properties of matter

CONTENT STANDARD C: Life Science
As a result of their activities, all students should develop understanding of
  ➤ Matter, energy, and organization in living systems

CONTENT STANDARD E: Science and Technology
As a result of activities, all students should develop
  ➤ Abilities of technological design
  ➤ Understandings about science and technology

CONTENT STANDARD F: Science in Personal and Social Perspectives
As a result of activities, all students should develop understanding of
  ➤ Science and technology in local, national, and global challenges

CONTENT STANDARD G: History and Nature of Science
As a result of activities, all students should develop understanding of
  ➤ Historical perspectives

◆ National Science Education Standards Grades 5-8 (ages 10 - 14)
  CONTENT STANDARD E: Science and Technology
  As a result of activities, all students should develop
    o Abilities of technological design
    o Understandings about science and technology

◆ National Science Education Standards Grades 9-12 (ages 14-18)
  CONTENT STANDARD E: Science and Technology
  As a result of activities, all students should develop
    o Abilities of technological design
    o Understandings about science and technology

◆ Next Generation Science Standards Grades 2-5 (Ages 7-11)
  Engineering Design
  Students who demonstrate understanding can:
  ➤ 3-5-ETS1-1.Define a simple design problem reflecting a need or a want that includes specified criteria for success and constraints on materials, time, or cost.
  ➤ 3-5-ETS1-2.Generate and compare multiple possible solutions to a problem based on how well each is likely to meet the criteria and constraints of the problem.
Standards for Technological Literacy - All Ages

The Nature of Technology
- Standard 1: Students will develop an understanding of the characteristics and scope of technology.
- Standard 3: Students will develop an understanding of the relationships among technologies and the connections between technology and other fields of study.

Technology and Society
- Standard 4: Students will develop an understanding of the cultural, social, economic, and political effects of technology.
- Standard 6: Students will develop an understanding of the role of society in the development and use of technology.
- Standard 7: Students will develop an understanding of the influence of technology on history.

Design
- Standard 8: Students will develop an understanding of the attributes of design.
- Standard 9: Students will develop an understanding of engineering design.
- Standard 10: Students will develop an understanding of the role of troubleshooting, research and development, invention and innovation, and experimentation in problem solving.

Abilities for a Technological World
- Standard 11: Students will develop abilities to apply the design process.
- Standard 13: Students will develop abilities to assess the impact of products and systems.
